

METHOD OF CREATING A CONCRETE PAVED AREA

A method of providing a paved area having a predetermined set of surface features. The method begins
5 with the pouring of wet concrete into a predetermined area. Then a predetermined thickness of the wet concrete is removed in a predetermined portion of the predetermined area, thereby creating a lower, upwardly facing surface in the predetermined portion. At this point, a paving tile
10 having the predetermined set of surface features is placed on the lower, upwardly facing surface. Finally, the wet concrete underneath and about the paving tile is permitted to cure.
